

Reliability and long service life

Anti-waterhammer design

Backpressure resistant

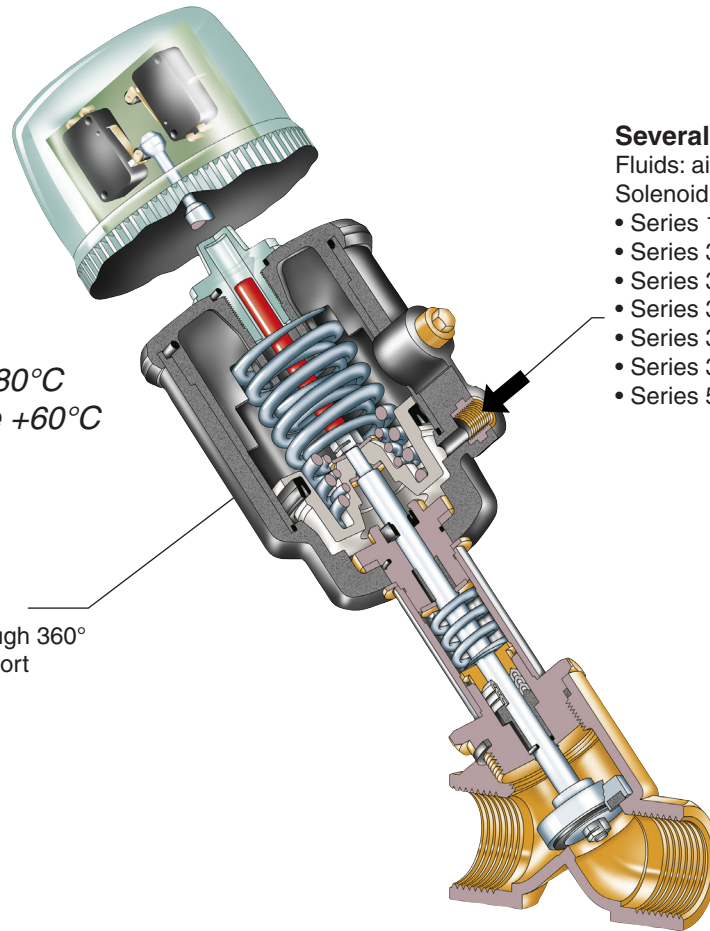

Angle-seat valves

series 290-390

- Excellent flow rate
- PN16
- Max. fluid temperature +180°C
- Max. ambient temperature +60°C

Easy assembly

Operator rotatable through 360° to position the piloting port

Several piloting choices:

Fluids: air or water from 1,5 to 10 bar

Solenoid pilot valves:

- Series 189 Banjo Ø 1,2 mm
- Series 356 Ø 1,6 mm G1/8-1/4
- Series 314 Ø 3,2 mm
- Series 325 Ø 1,2 mm
- Series 314 Ø 1,2 - 2,4 et 3,2 mm
- Series 320 Ø 3,2 mm
- Series 551 NAMUR with interface

Globe valves

series 298-398

- Thermal shock resistant
- PN40
- Max. fluid temperature +250°C
- Max. ambient temperature +180°C
- 3/2 Universal
- Simple and easy maintenance, fully disassemblable valve

Bi-directional fluid flow

Pressure can be applied to any orifice as required by the process

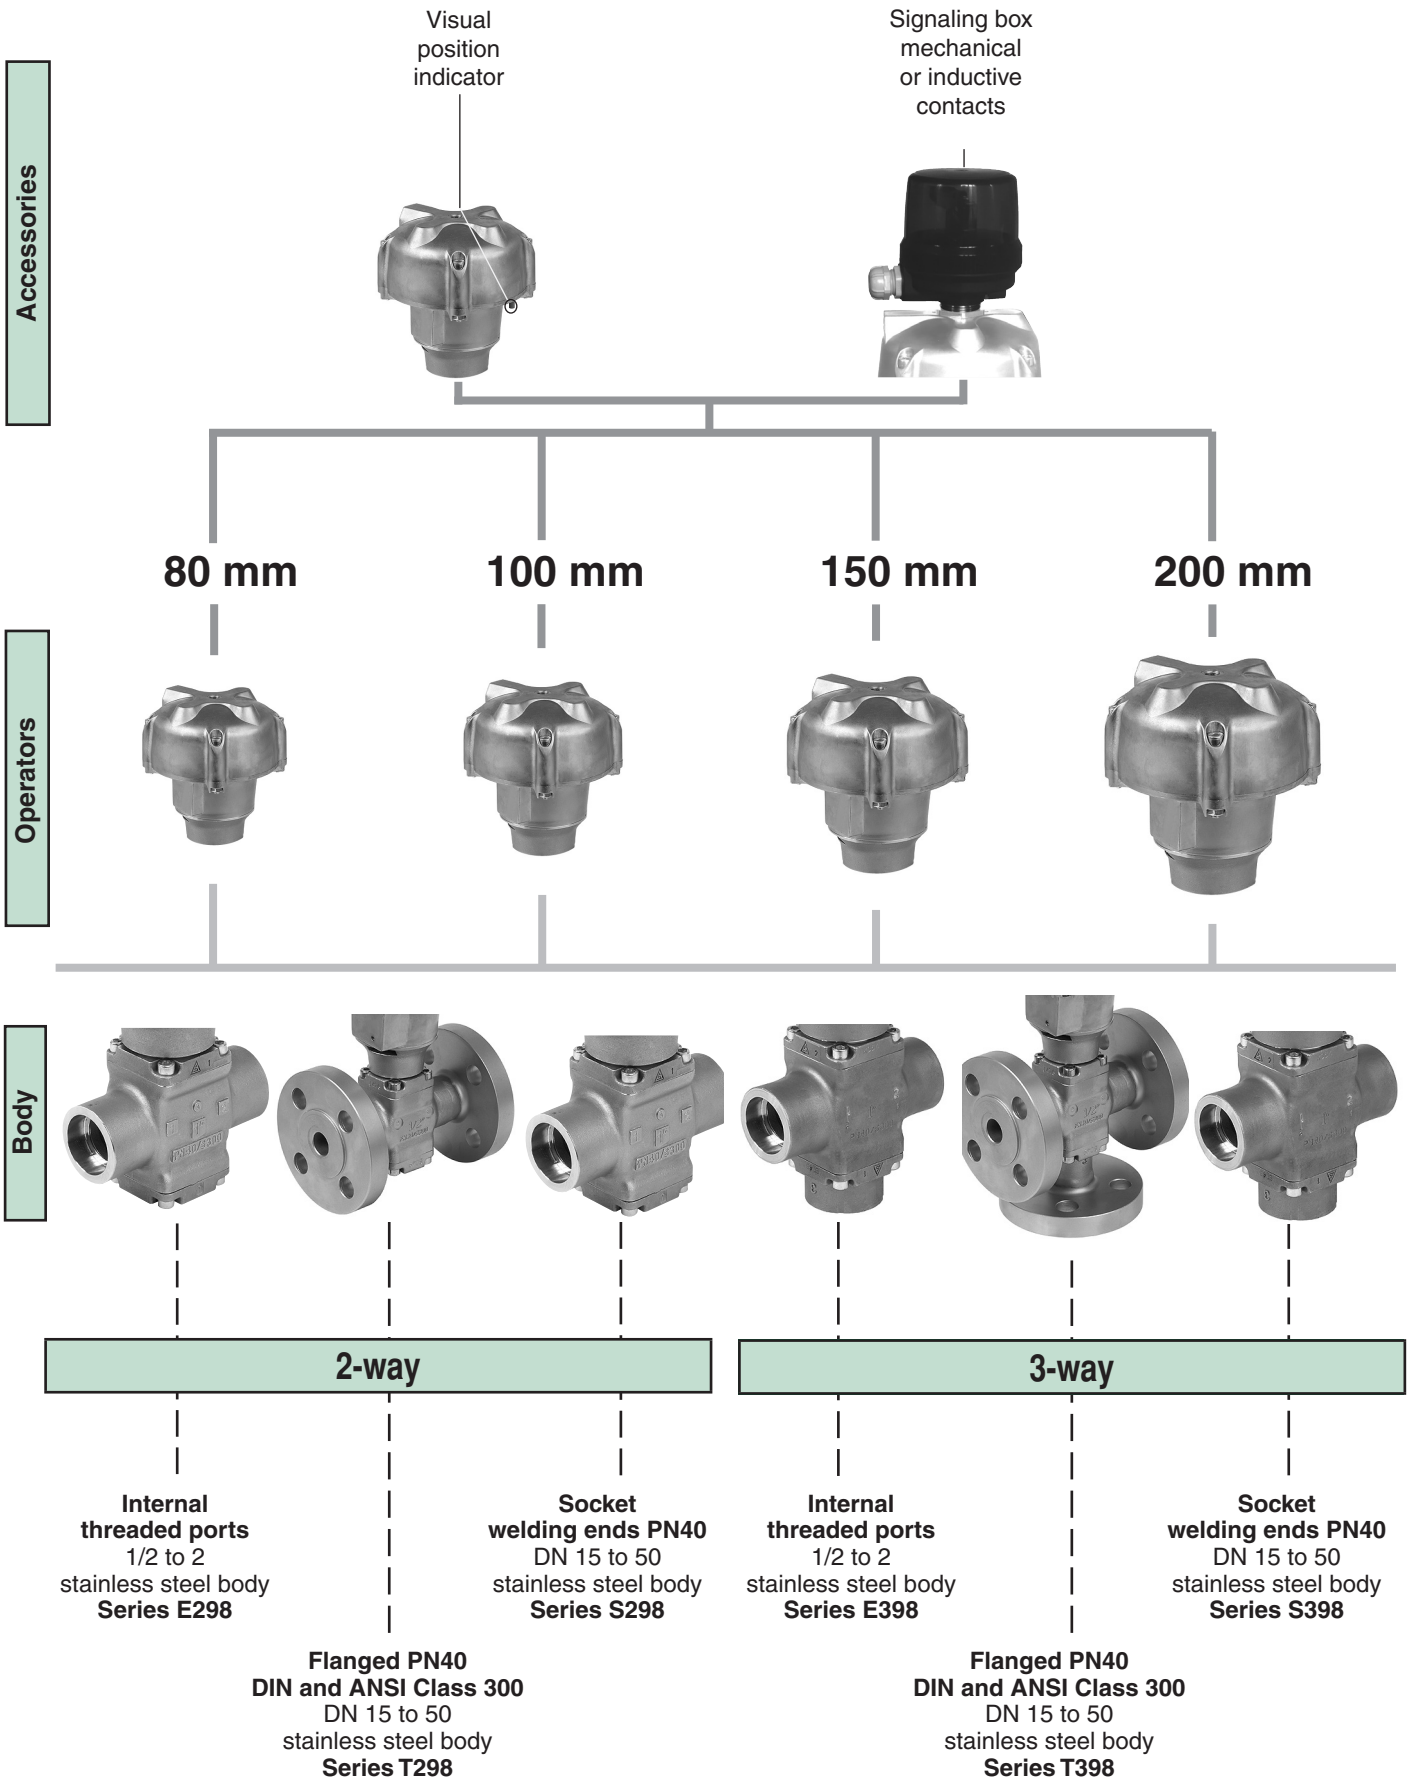

A wide range of valves for all fluid applications

For exact material selection and combinations, refer to the appropriate catalogue pages.

A wide range of valves for all fluid applications

00047GB-2017/R01

⁽¹⁾ min. pilot pressure: See pilot pressure graphs on the respective catalogue page.

Selection and operation of a valve depend on two parameters:

- The maximum differential pressure (ΔP) across the valve in closed position
- The minimum pilot pressure necessary to control the valve

Series 290 - 390 valves can be equipped with diameter 32, 50, 63, 90 or 125 mm operators.

The valve is kept in the closed position by spring (T) (X) and/or (Y). It is opened by pilot pressure (Pp) under the piston (Z).

The operators are standard available as follows:

operators	return spring	pilot pressure (bar)		range of applications
		min.	max.	
32 - 50	T	4	10	high ΔP typical applications
63 - 90 - 125	X + Y	4	10	

To meet the requirements of different applications, 63-90-125 mm operators are available in two other versions:

63 - 90 - 125	Y	2,5	10	average ΔP low pilot pressure
	X	1,5	10	low ΔP very low pilot pressure

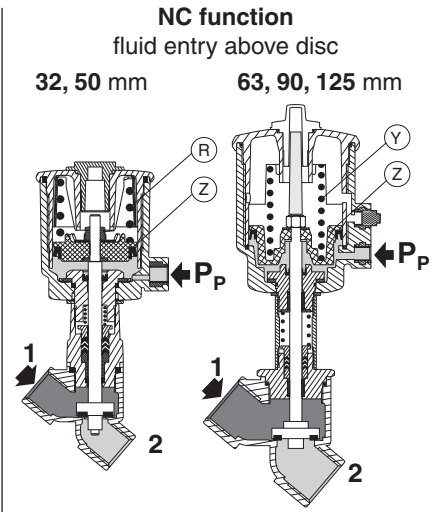

The valves are kept in the open position by return spring (S) or (X).

The valve is closed by pilot pressure (Pp) on piston (Z).

In the closed position, the pilot pressure must overcome the force of the return spring and that created by the ΔP under the disc.

The minimum pilot pressure varies as a function of the ΔP to which the valve is subjected.

This function is recommended for steam systems (184°C max.) with high cycling rates.

Not to be used with liquids as waterhammer may occur.

Valves are maintained in the closed position by spring (R) or (Y).

The valve is opened by pilot pressure (Pp) under piston (Z). The pilot pressure must overcome the force of the return spring and that generated by the ΔP on the disc.

The minimum pilot pressure varies as a function of the ΔP to which the valve is subjected.

Series 298 - 398 valves can be equipped with diameter 80, 100, 150 or 200 mm operators.

The minimum pilot pressure varies as a function of the ΔP to which the valve is subjected. Low pilot pressure operation is standard on all 298 - 398 valves.

The valve is kept in the closed position by spring (X1). It is opened by pilot pressure (Pp).

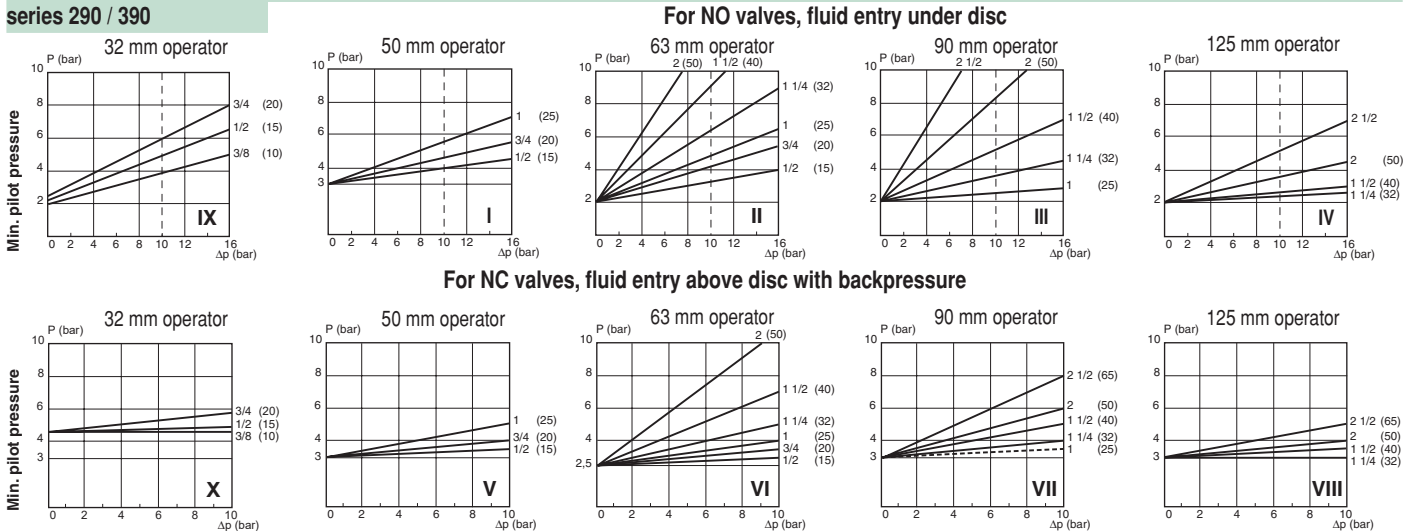

The valves are kept in the open position by return spring (Y1). It is closed by pilot pressure (Pp).

The valves are held in position by return spring (Z1). Pilot pressure (Pp).

SELECTION OF THE MINIMUM PILOT PRESSURE

series 290 / 390

series 298 / 398
