These pressure switches maintain a constant pressure around a chosen set value: regulator action. They trigger an alarm or safety system, when the pressure reaches a critical pre-set value.

Important

Normal operation must be between 10% and 90% of the selected scale. The deadband values in the table overleaf are defined under these conditions.

All circuits must be equipped with a safety system protecting them against excess pressure.

Any pulsating circuit must be fitted with pulsation dampeners. Suitable separators must be used with incompatible process fluids.

Operating principle

A flexible diaphragm actuates a microswitch by means of a piston. The set point is adjusted by means of a compressible spring installed in opposition.

The installation must be in accordance to U_{max} and I_{max}

All necessary measures must be taken by the user, to avoid the calorific transfer from the fluid to the apparatus head increasing the head's temperature to such that it reaches the self-ignition temperature of the gas in which it is used.

$$\begin{aligned} U_{max} &= 30 \text{ Vdc} \\ I_{max} &= 66 \text{ mA} \\ P &= 0,5 \text{ W} \\ C_a &> C_i + C_{cable}; L_a > L_i + L_{cable} \\ C_i &= \text{Negligible}; L_i = \text{Negligible} \end{aligned}$$

Don't forget the barrier's resistors in the determination of $Rc1$.

In area 0, the loop calculation of the association pressure switches with safety barrier must be approved by notified organism.
